CODE FLOWCHART

Learn the logic used to create a program that generates
real estate rental budgets.

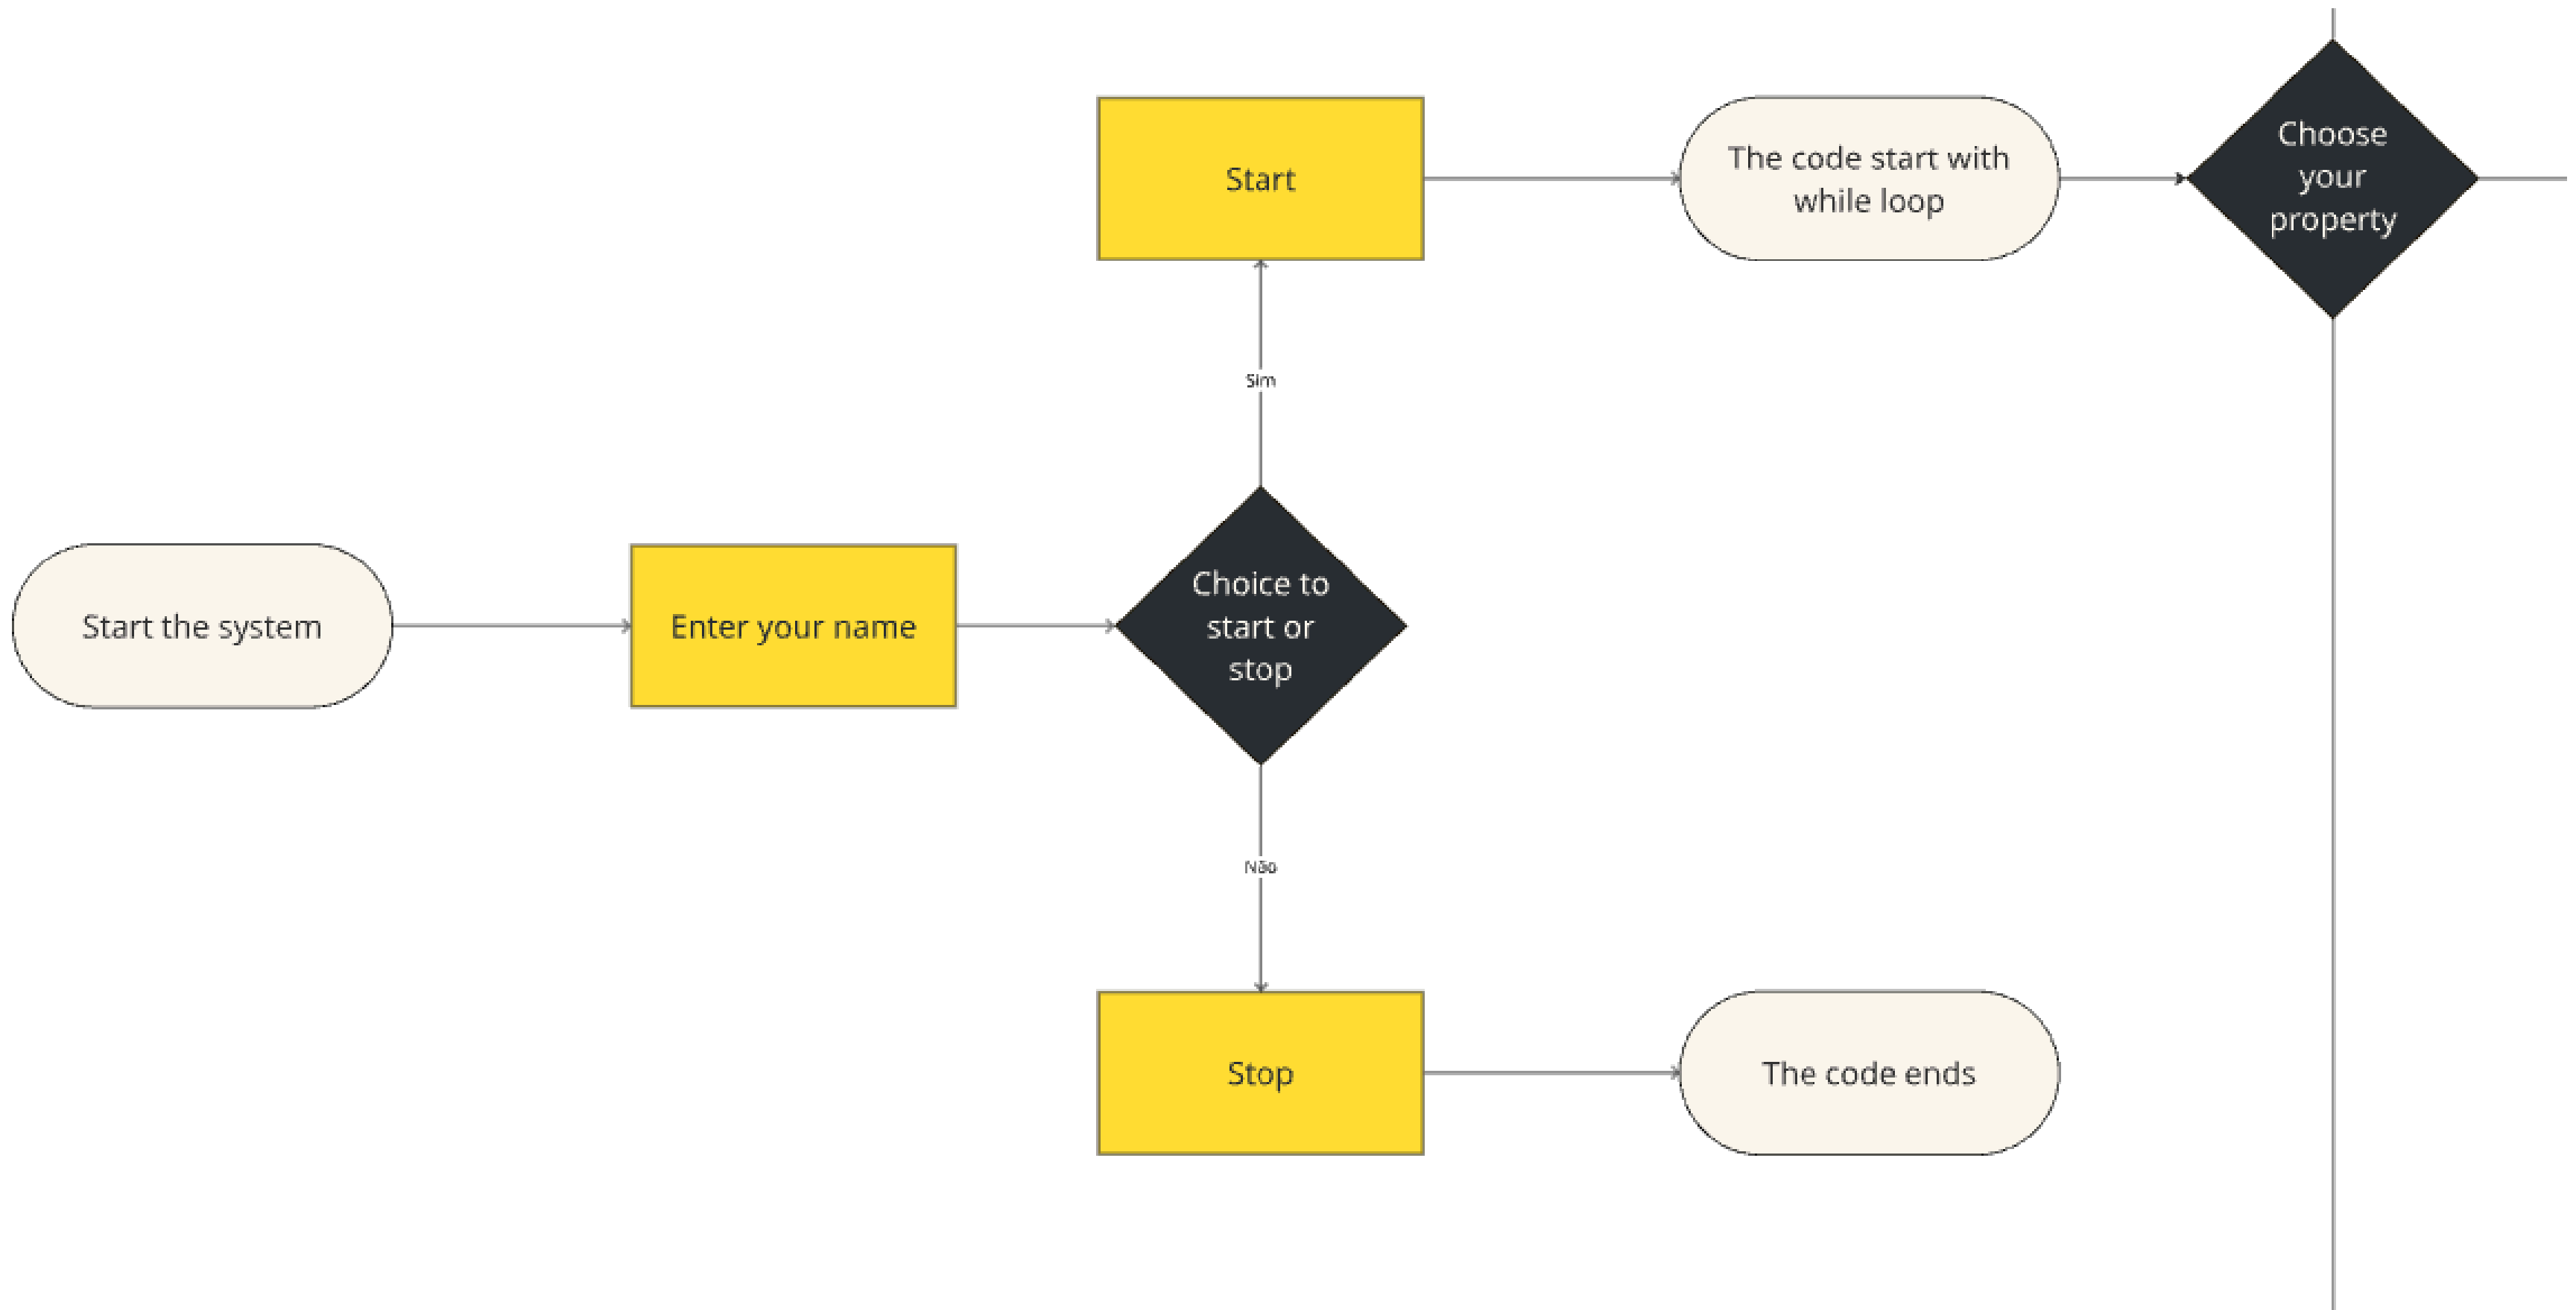

× × × ×

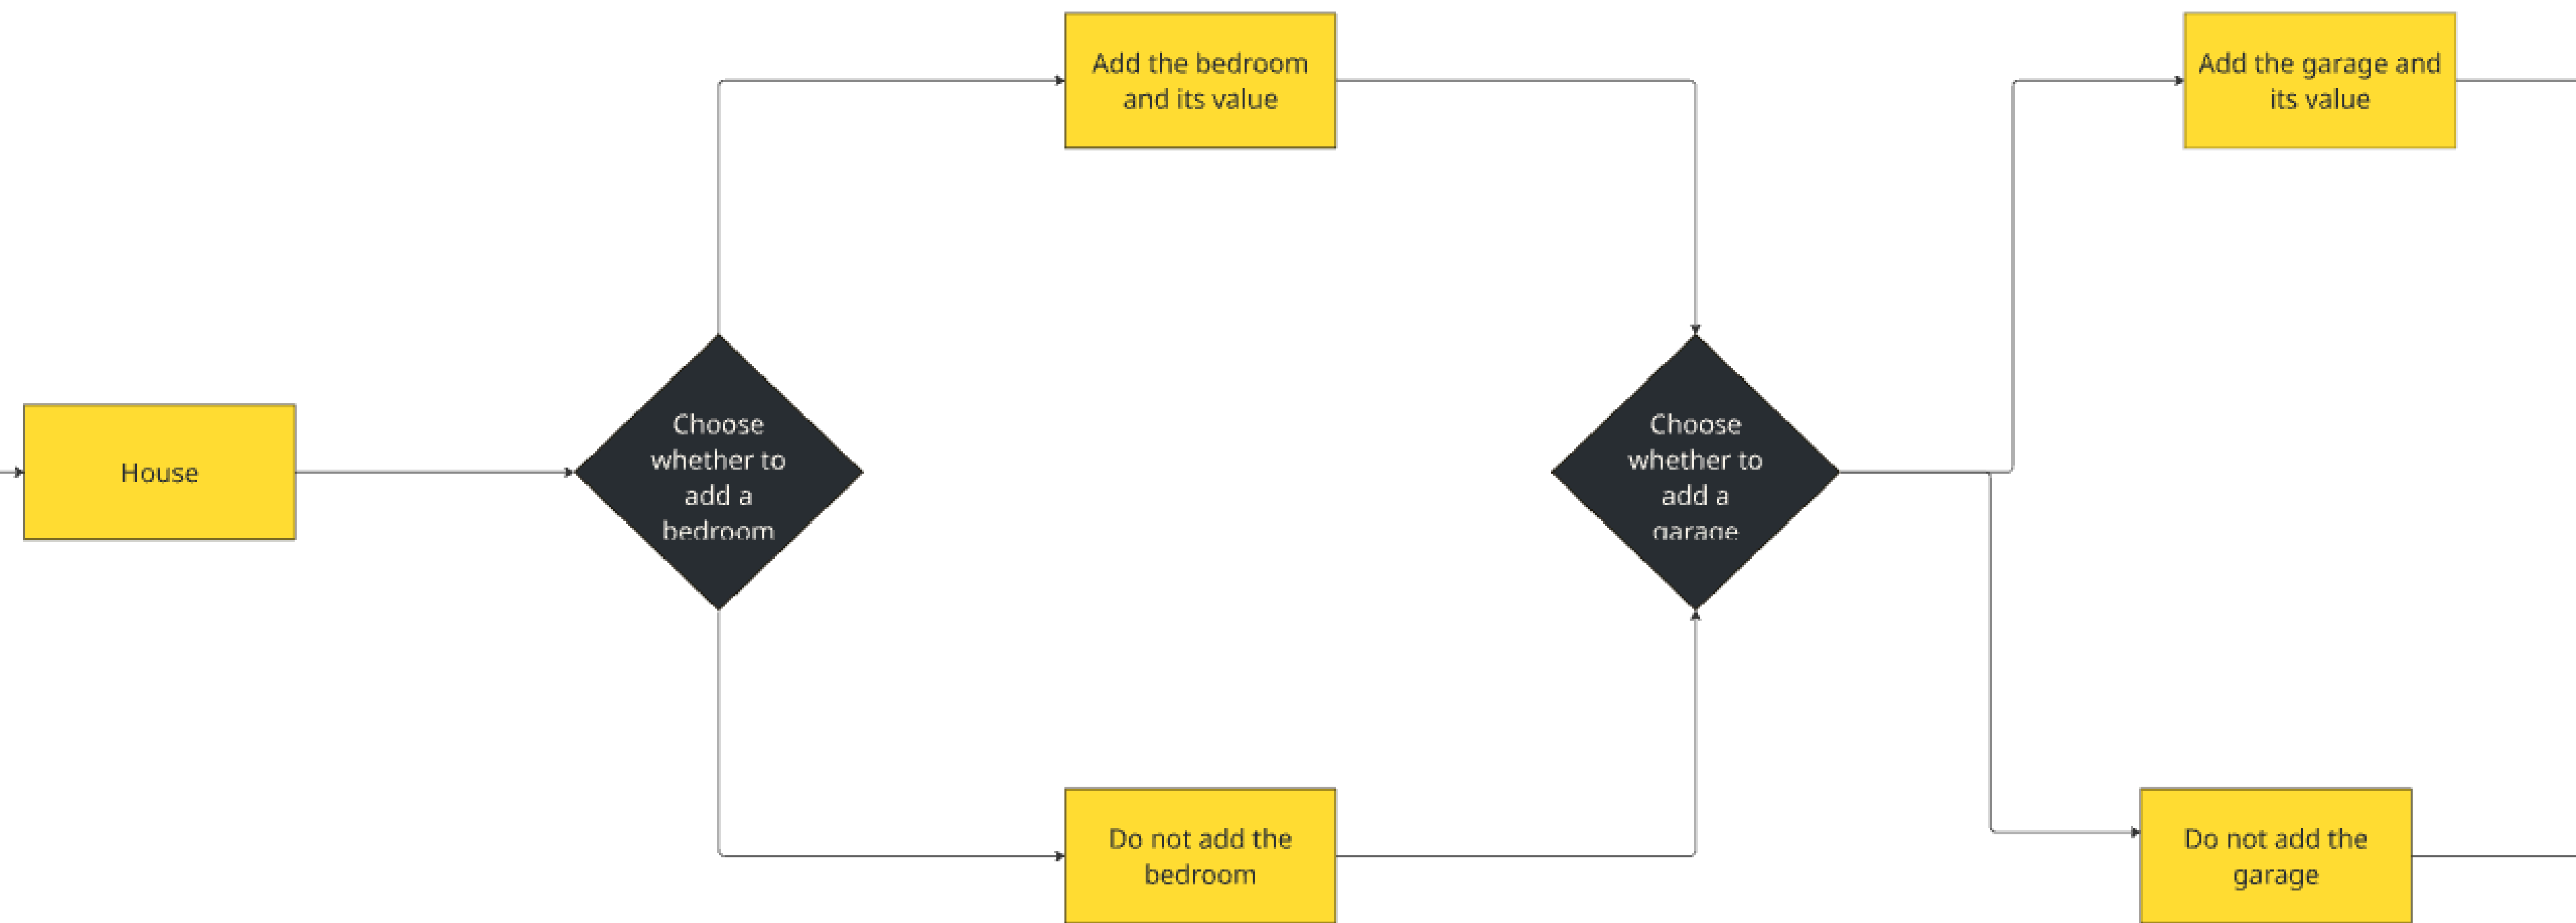

SUMMARY

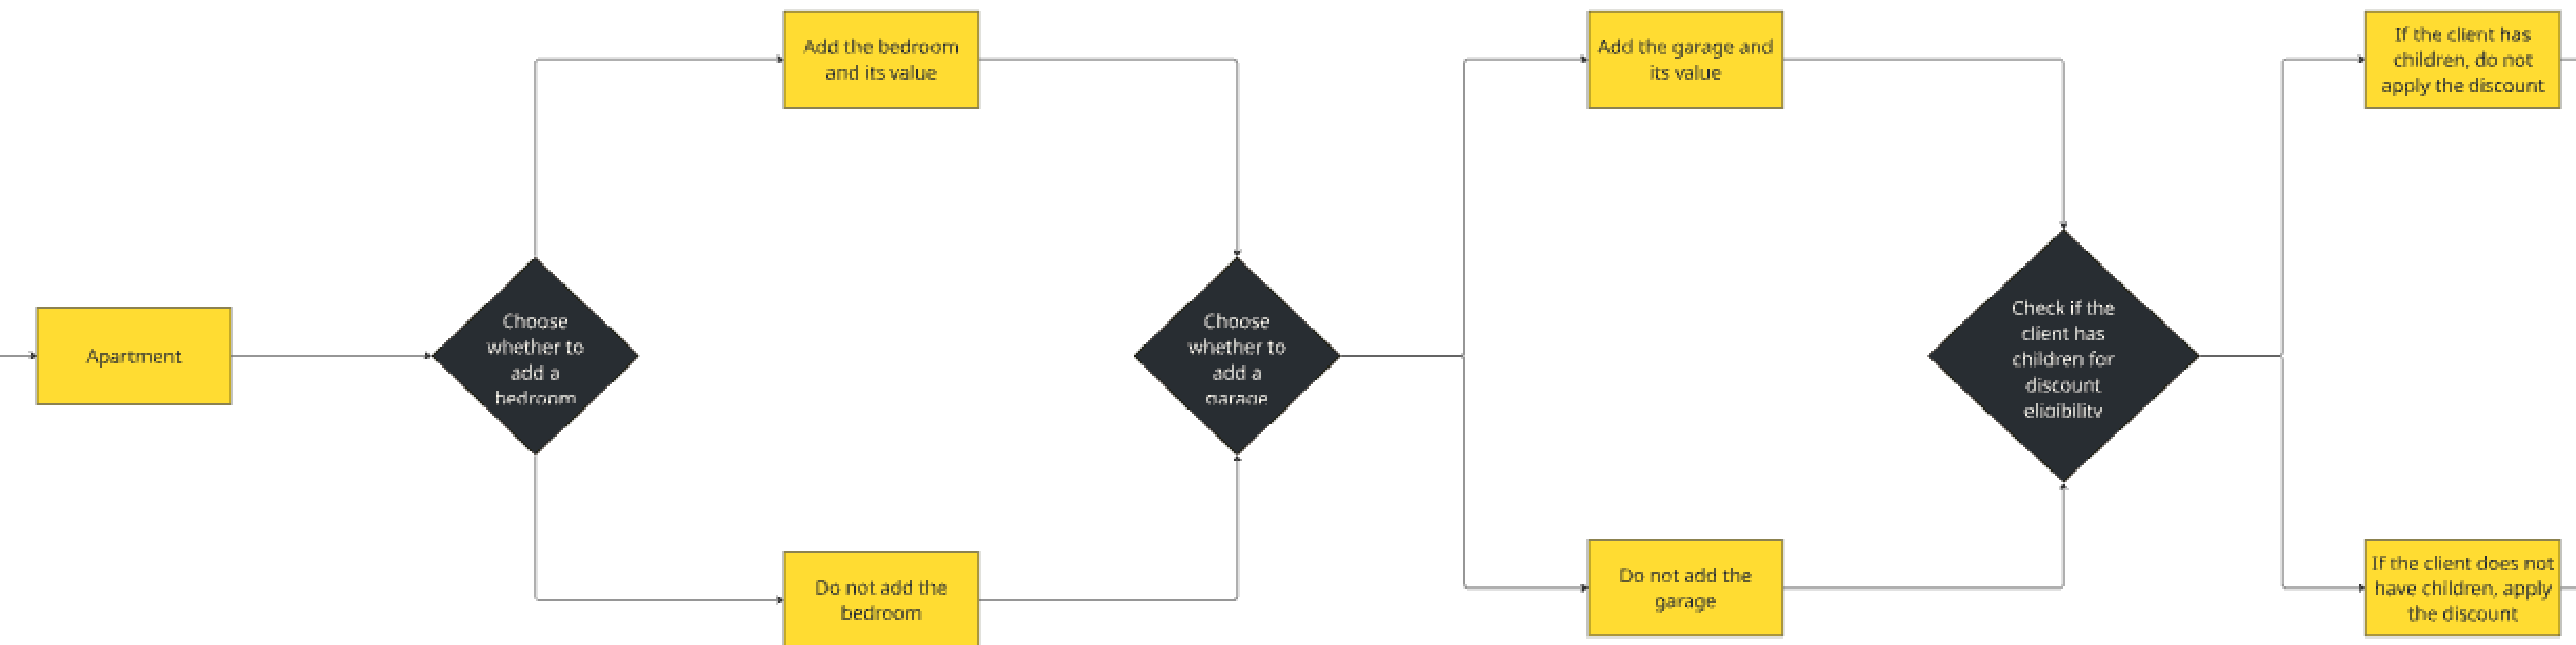

You will see the timeline of how the program is used.

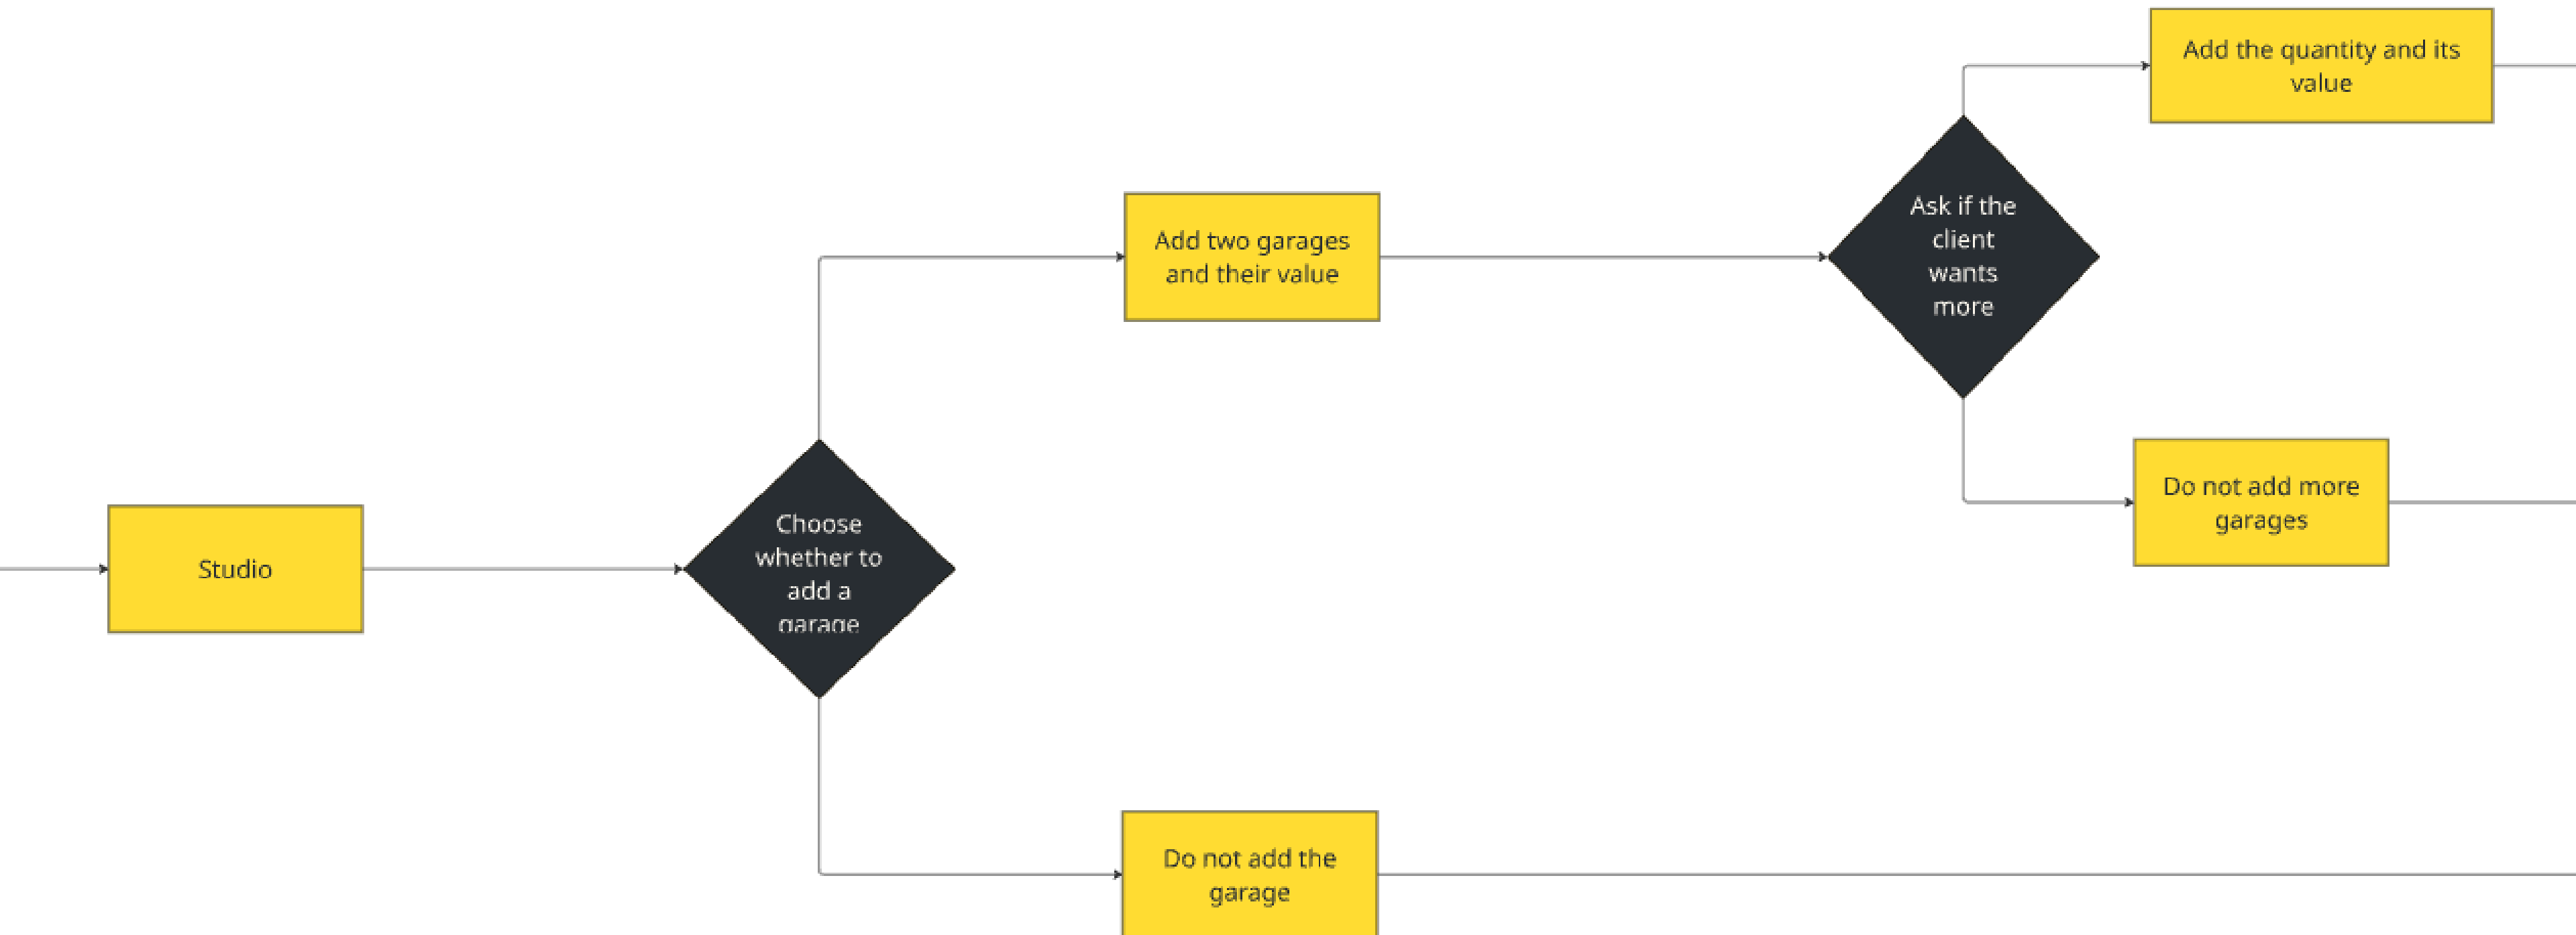

The system requests the client's data, allows the choice of property type (House, Apartment, or Studio), and applies the business rules, such as additional charges per bedroom and parking space, a 5% discount for apartments without children, and calculation of the contract fee split into up to 5 installments. Finally, the program generates a .csv file with the 12 installments of the budget, showing the monthly amount and the total annual cost.

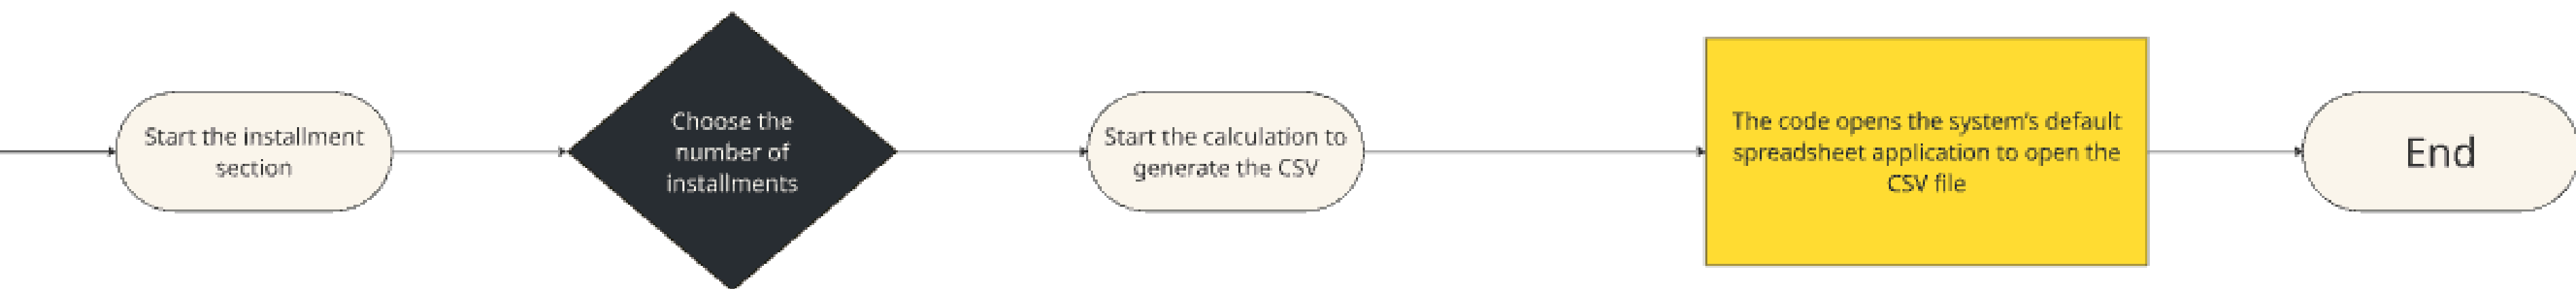

Flowchart created with Miro. Due to export quality issues, this presentation was made in Canva. If you want to see the original, the link is below:
